

The following is a brief evaluation and objective assessment of the product Xpoint. The undersigned and Erik Vind has been evaluating ScriptServer/ Xpoint since early 2011 for potential investors.

General

Since 2009 ScriptServer Solutions has developed a new platform: xPoint, which was completed at the platform level in autumn 2010, and after the testing period is now installed in about 10 copies.

Xpoint brings and provides great opportunities in the market within the ERP / e-commerce and CMS. The system is in the time of writing the only of its kind as to direct on-line access to a Navision platform that allows the user immediate update and setup of new sales opportunities.

Currently, 11 apps/components are finished for the X-point platform, such as CMS: Newsletter, News Section, e-commerce: Self Service, Product Card, Catalog Tree and Order Process. All ScriptServers e-commerce solutions have always been 100% online integrated into customers' financial and ERP systems (Microsoft Dynamics NAV). Which means that customers only needs to update their e-commerce one place, and their customers can see inventory and order the item in real time.

Business efficiency

Xpoint provides a clear benefit to all users, since it is not necessary with the use of in-or outside consultants for customizing or creating new products.

Technically, this is set up via an optimal code, which is covering all business functionalities for online shopping between xPoint and Microsoft Dynamic NAV.

Process optimization

Internal business processes are optimized through the use of Xpoint with a factor that marked has not previously seen. Technically 'this is being implemented through real time on-the-fly data exchange between xPoint and Microsoft Dynamic NAV through NAS (Navision Application Server) and the latest Windows technologies (.NET, WCF, WPF, Web Services).

Capabilities of the system includes failover automatic processes, replication of data and load balancing over the business data layer.

Interoperability

Xpoint can be implemented without adaptation and operate on all Navision platforms from Navision 3.7x to the latest NAV 2009 R2. Custom adaptors can be developed on the system core to connect to different data stores, or even plain databases.

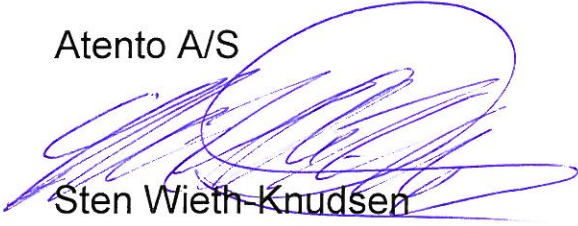

User flexibility

When Xpoint is installed, only a very short training to coming users are required. The system is extremely user friendly and will reduce the use of consultants significantly in the future. The Xpoint GUI allows immediately change of tables and data fields from NAV without any further programming skills. Additionally the platform offers scalable updating system that will add new features as the components are been developed to the administrators and the users of the system.

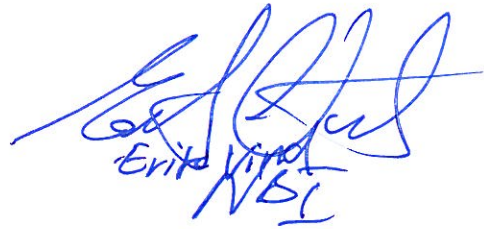

Conclusion.

Xpoint will with the right commercial setup have very high potential for worldwide sales to all ERP platforms.
